Blockchain can be a difficult topic to comprehend, especially for beginners without much of a technical background. But it really doesn't have to be. All it takes is one person who is good at explaining things on a very basic and fundamental level, and that is where I excel. I have written this book with the extreme beginner in mind. Most introductory guides to Blockchain will begin their story in 2008, with the advent of Bitcoin. These accounts are quite accurate, but only paint half of the picture. The fundamental purpose of Blockchain technology and its uses goes back much further than 2008. In order to truly grasp Blockchain technology, we must reach back to the time before computers, paper currency, or even money itself. The answer to this question will take us on an adventure going back thousands of years, by first delving into the burning question of what money is, and from there, tracing it's trajectory throughout history to the development of Blockchain technology. This brief history of money is necessary to understand present-day effects of Blockchain applications, such as Bitcoin and Ethereum, both of which will be introduced in this book. Some of the topics that you are going to learn about in this book include: Understanding Blockchain and what exactly it is What a distributed ledger is (Simplified!) Blockchain's Effect on Money and Banking Bitcoin and its relationship with Blockchain Ethereum and what makes it so great FinTech's Impact on business startups Where will Blockchain be in 20 years? Learn more about **BLOCKCHAIN TECHNOLOGY!** Blockchain is a decentralized ledger of transactions. You can look at blockchain as a large database of records that is managed by different people, including you - instead of counting on certain organizations to manage your data. You can think of it as a spreadsheet that is sent over a network of computers, which is made in order to regulate the spreadsheet so everybody can make sure every record in it is correct. As what the term blockchain suggests, each procedure of every transaction is kept as a block, which links to everything that comes after it. The said blocks are then stored in a network where everyone has a copy of the block so that they can be easily accessed. However, each block is protected by a certain key, so it doesn't get tampered by anyone within the network. What does that mean, then? Currently, every file or record that is important to you is managed by an organization that you trust - banks, insurance providers, credit card companies, the government, human resources,

and other similar bodies exist because of the value of trust that people give them. Because they operate with the virtue of trust, these organizations are the ones that manage most, if not all of the transactions that involve money. To make sure that your records and transactions are protected, your data is made safe in a centralized database that only certified personnel are authorized to access. While, blockchain promises to distribute data in such a way that there is not a single processor that would be handling it. For example, instead of having one or a couple of servers storing data for an insurance, everybody that is joined to a network will have access to insurance data. Yes, that's right - this would also mean that your data is going to be shared between several people that needs to come to an agreement on its integrity. Blockchain may seem like a jargon at the moment, most of the things that you come across in your daily life are bound to be transformed by this concept. This seemingly imminent concept is already here and is little by little being adapted in economics, trade, and even in the most straightforward transactions that you do.
